

Solutions for Family Law

Prove Sobriety—Maintain Custody and Visitation Rights

In divorce, custody, or visitation cases, when a parent's alcohol issues are called into question, the ability to care for children in the home becomes a concern. Judges, family law attorneys, alternate dispute arbitrators, or social service agencies may regularly require parents to take sobriety tests. A parent involved in a custody or visitation arrangement may also volunteer to validate sobriety. Using the right alcohol detection tool, results in sound custody and visitation decisions. The BI SL3® handheld breathalyzer makes it easy to monitor sobriety, while driving compliance and accountability.

Benefits of Mobile Alcohol Detection

SL3 is a lightweight, user-friendly alcohol detection device that discreetly prompts the user to test. This is convenient for individuals who may be at work or in a social setting. SL3 uses the highest quality fuel-cell sensor to achieve an accuracy level within .005 Breath Alcohol Content (BrAC). Plus, near real-time delivery of results offers immediate peace of mind for families in custody or visitation arrangements.

Receiving urinalysis results can take days, and negative results do not necessarily mean abstinence, as alcohol can quickly be eliminated from the body. With SL3, multiple tests per day can be conducted at scheduled or random times per the custody or visitation agreement. Notifications are sent to the client's mobile device, prompting them to submit a test. Test results are then conveniently sent to the client's mobile phone or email in real time.
